

Practice 3

1. Following the Practice 2.5, define a **RedDrug** class with the attributes **String size** and **int addLife**. The size can be {Large, Medium, Small}, which increases life points by {120, 80, 50} respectively. Define a **BlueDrug** class with the attributes **String size** and **int addMagic**. The size can be {Large, Medium, Small}, which increases magic points by {100, 60, 30} respectively.
In the **ROLE** class, define virtual methods **DrinkRed(RedDrug R)** and **DrinkBlue(BlueDrug B)**.

When a character's life is less than 100 or magic is less than 70, they will drink based on the following probabilities:

- i. 10% : Drink a large bottle
 - ii. 30% : Drink a medium bottle
 - iii. 40% : Drink a small bottle
 - iv. 20% : No drink available
2. Define a parent class named **Drug** , and have **RedDrug** and **BlueDrug** inherit from it. Change the virtual methods in the **ROLE** class from **DrinkRed(RedDrug R)** and **DrinkBlue(BlueDrug B)** to **Drink(Drug D)**.
